Electromechanical pressure and vacuum switches

XM range

Function

The function of pressure and vacuum switches is the control or regulation of pressure or vacuum levels in hydraulic or pneumatic systems.

They transform the pressure change into a digital electrical signal when the preset switching points are reached.

Switches for power circuits

Switches with power electrical contacts, either 2-pole or 3-pole, designed for direct switching of single-phase or 3-phase motors (pumps, compressors, etc.).

Switches for control circuits

Switches with standard electrical contacts, designed for control of contactors, relays, power valves, PLC inputs, etc.

Pressure switch operating principle

Detection of a single threshold

The switches for detection of a single threshold (fixed differential) have a single adjustable setting point (PH). The differential between the high and low points (PH - PB) depends upon the natural characteristics of the switch. It is not adjustable.

Example: contact schematics of XMLA

— Adjustable value
--- Non adjustable value

PH = High point
PB = Low point

Regulation between 2 thresholds

The switches for regulation between 2 thresholds (adjustable differential) have both a high point setting (PH) and a low point setting (PB). Both of these points can be independently adjusted.

Example: contact schematics of XMLB

— Adjustable value

PH = High point
PB = Low point

Detection of 2 thresholds

The dual stage switches, for detection at each threshold, have an adjustable high point setting for each stage (PH1 and PH2). Both of these points can be independently adjusted. For both stages, the differential between the high point and the low point (PH1 - PB1 and PH2 - PB2) depends upon the natural characteristics of the switch. It is not adjustable.

Example: contact schematics of XMLD

— Adjustable value
--- Non adjustable value

PH = High point
PB = Low point

Electromechanical pressure and vacuum switches

XM range

Terminology

Operating range

The difference between the minimum low point (PB) and the maximum high point (PH) setting values.

Size

Pressure switches and vacuum-pressure switches (vacu-pressure switches)
Maximum value of the operating range.

Vacuum switches

Minimum value of the operating range.

Switching point on rising pressure (PH)

Pressure switches

The upper pressure setting at which the pressure switch will actuate the contacts on rising pressure.

Vacuum switches

The lower vacuum setting at which the vacuum switch will reset the contacts on rising pressure.

Switching point on falling pressure (PB)

The pressure at which the switch output changes state on falling pressure.

Switches with fixed differential

The lower point (PB) is not adjustable and is entirely dependent on the high point setting (PH) and the natural differential of the switch.

Switches with adjustable differential

The adjustable differential enables the independent setting of the lower point (PB).

Differential

The difference between the switching point on rising pressure (PH) and the switching point on falling pressure (PB).

Spread

For dual stage switches, the spread indicates the difference between the 2 switching points on rising pressure (PH2 and PH1) and, for vacuum switches, the difference between the 2 switching points on falling pressure (PB2 and PB1).

Accuracy (switches with setting scale)

The tolerance between the point at which the switch actuates its contacts and the value indicated on the setting scale. Where very high setting accuracy is required (initial installation of the product), it is recommended to use separate measuring equipment (pressure gauge, etc.).

Electromechanical pressure and vacuum switches

XM range

Terminology (continued)

Repeat accuracy (R)

The tolerance between two consecutive switching operations.

Drift (F)

The tolerance of the switching point throughout the entire service life of the switch.

Accidental overpressure

This is an accidental pressure surge of very short duration (a few milliseconds).

If accidental overpressures occur and their duration is less than 50 milliseconds, the pressure damping device incorporated in the XML switches (sizes 10 bar and greater) will diminish the effect.

Example 1: with destructive pressure level.

Example 2: with destructive pressure level and destructive pressure oscillations.

— Without damping device
— With damping device

Maximum permissible pressure per cycle (Ps)

A pressure switch can withstand this pressure, without detrimental effect, on each cycle throughout its service life.

Its minimum value is at least equal to 1.25 times the switch size.

Maximum permissible accidental pressure

The maximum accidental pressure is at least equal to 2.25 times the switch size.

Destruction pressure

The maximum guaranteed pressure that the switch will withstand before its destruction, i.e. bursting, rupturing, component failure, etc.

Its value is at least equal to 4.5 times the switch size.

Electromechanical pressure and vacuum switches

XM range

Application range of pressure and vacuum switches XML, XMA and XMX, for control circuits

On standard loads
Continuous duty, frequent switching.

- 1 Standard PLC input, type 1
- 2 Standard PLC input, type 2
- 3 Switching capacity conforming to IEC 60947-5-1, utilisation category AC-15, DC-13
B300 240 V 1.5 A
R300 250 V 0.1 A
- 4 Switching capacity conforming to IEC 60947-5-1, utilisation category AC-15, DC-13
B300 120 V 3 A
R300 125 V 0.22 A

PLC: Programmable Logic Controller

On small loads

The use of electromechanical pressure and vacuum switches with programmable logic controllers is becoming more predominant.
On small loads, the reliability of the switches maintain a failure rate of less than 1 for 100 million operating cycles.

Selection of switch size

After establishing the type of switch required for the application (single threshold detection or regulation between 2 thresholds), the selection of its size will depend on the following criteria:

- ☐ the differential: difference between the high point (PH) and the low point (PB),
- ☐ the maximum pressure permissible per cycle,
- ☐ repeat accuracy, precision and minimum drift.

Examples of a fixed differential pressure switch selection, for detection of a single threshold

Main criterion: minimum differential

Example: for a selected high point (PH) of 7 bar

XMLA010●●●●●●
Differential = 0.5 bar

Select an XMLA010●●●●●● (the lowest size)

XMLA020●●●●●●
Differential = 1 bar

XMLA035●●●●●●
Differential = 2 bar

Main criterion: tolerance to overpressures

Example: for a selected high point (PH) of 12 bar

XMLA020●●●●●●
Permissible accidental overpressure = 45 bar

Select an XMLA035●●●●●● (the highest size)

XMLA035●●●●●●
Permissible accidental overpressure = 80 bar

Main criterion: repeat accuracy, precision and minimum drift

Example: for a selected high point (PH) of 18 bar

XMLA020●●●●●●

Adjustable from 1 to 20 bar

Select an XMLA035●●●●●●

XMLA035●●●●●●

Adjustable from 1.5 to 35 bar

As a general rule, working at the upper or lower limits of the operating range should be avoided.

Units of pressure conversion table

	psi	kg/cm ²	bar	atm	mm Hg (Torr)	mm H ₂ O	Pa
1 psi =	1	0.07031	0.06895	0.06805	51.71	703.7	6895
1 kg/cm ² =	14.22	1	0.98066	0.96784	735.55	10 000	98 066
1 bar =	14.50	1.0197	1	0.98695	750.06	10 197	10 ⁵
1 atm =	14.70	1.0333	1.0132	1	760.0	10 333	101 325
1 mm Hg = (Torr)	0.01934	1.360 x 10 ⁻³	1.333 x 10 ⁻³	1.316 x 10 ⁻³	1	13.59	133.3
1 mm H ₂ O =	1.421 x 10 ⁻³	10 ⁻⁴	~ 10 ⁻⁴	~ 10 ⁻⁴	0.07361	1	~ 9.80
1 Pa =	1.45 x 10 ⁻⁴	1.0197 x 10 ⁻⁵	10 ⁻⁵	9.8695 x 10 ⁻⁶	7.5 x 10 ⁻³	0.10197	1

Example: 1 bar = 14.50 psi = 10⁵ Pa

Electromechanical pressure and vacuum switches

Fixed differential switches, for detection of a single threshold

Adjustment range of the high point

Defined by the difference between the minimum and maximum high point (PH) setting values.

For a high set point (PH), the lower point (PB) is fixed and cannot be adjusted.

For a low set point (PB1 or PB2), the higher point (PH1 or PH2) is fixed and cannot be adjusted.

Switching point on rising pressure (PH)

The upper pressure setting at which the pressure or vacuum switch will actuate the contacts on rising pressure.

Adjustable throughout the range on rising pressure.

Switching point on falling pressure (PB)

The pressure at which the switch contact changes state on falling pressure.

The lower point (PB) is not adjustable and is entirely dependent on the high point setting (PH) and the natural differential of the switch.

Differential

$PH - PB = \text{natural differential}$

The difference between the switching point on rising pressure (PH) and the switching point on falling pressure (PB).

This point is not adjustable and therefore, the value of the differential is fixed. It is the natural differential of the switch (contact differential, friction, etc.).

Example

■ Consider a switching point on rising pressure (PH) of 40 bar (set value at which the contact will change state on rising pressure).

■ It can be seen that the switching point on falling pressure (PB) is 28 bar (fixed value at which the contact will return to its original state).

Conclusion:

□ the differential will be $40 - 28 = 12$ bar.

Electromechanical pressure and vacuum switches

Adjustable differential switches, for regulation between 2 thresholds

Adjustment range of the high point

Defined by the difference between the minimum and maximum high point (PH) setting values.

Switching point on rising pressure (PH)

The upper pressure setting at which the pressure or vacuum switch will actuate the contacts on rising pressure.

Adjustable throughout the range on rising pressure.

Switching point on falling pressure (PB)

The pressure at which the switch contact changes state on falling pressure.

The adjustable differential enables the independent setting of the lower point (PB).

Differential

Low point < High point
 $PH - PB' = \text{natural differential}$
 $PH - PB'' = \text{minimum differential}$

The difference between the switching point on rising pressure (PH) and the switching point on falling pressure (PB).

Note: the low point can be set at any value between PB' and PB'' .

Example

- 1 Maximum differential
- 2 Minimum differential

■ Consider a switching point on rising pressure (PH) of 22 bar (set value at which the contact will change state on rising pressure).

■ It can be seen that the switching point on falling pressure (PB) can be between 4 and 19 bar inclusive (set value at which the contact will return to its original state).

Conclusion:

- the maximum differential will be: $22 - 4 = 18 \text{ bar}$,
- the minimum differential will be: $22 - 19 = 3 \text{ bar}$.

Operating curves (switching points on rising pressure)

Electromechanical pressure and vacuum switches

Dual stage, fixed differential switches, for detection at each threshold

Adjustment ranges of the switching points PH1 and PH2 on rising pressure

Defined by the difference between the minimum and maximum high point setting values of each stage (PH1 and PH2).

Switching point PH2 on rising pressure

The upper pressure setting at which the pressure or vacuum switch will actuate the contacts on rising pressure.

Adjustable throughout the range on rising pressure.

Switching point PH1 on rising pressure

The upper pressure setting at which the pressure or vacuum switch will actuate contact 1 on rising pressure.

Spread

$PH1 < PH2$
 $PH2 - PH1' = \text{maximum spread}$
 $PH2 - PH1'' = \text{minimum spread}$

The difference between switching points PH2 and PH1 on rising pressure.

Note: switching point PH1 can be set at any value between PH1' and PH1''.

Example:
Determining switching points on rising pressure for the 2 stages

- 1 Maximum spread
- 2 Minimum spread

■ Consider a 2nd stage switching point on rising pressure (PH2) of 20 bar (set value at which contact 2 will change state on rising pressure).

■ It can be seen that the 1st stage switching point (PH1) can be set between 4.5 and 17 bar on rising pressure.

Conclusion:

- the maximum spread will be:
 $20 - 4.5 = 15.5 \text{ bar}$,
- the minimum spread will be:
 $20 - 17 = 3 \text{ bar}$.

Operating curves (switching points on falling pressure)

Electromechanical pressure and vacuum switches

Dual stage, fixed differential switches, for detection at each threshold

Adjustment range of high point (PH1 or PH2)

Defined by the difference between the minimum and maximum high point (PH1 or PH2) setting values for each stage.

For a high set point (PH), the lower point (PB) is fixed and cannot be adjusted.
For a low set point (PB1 or PB2), the higher point (PH1 or PH2) is fixed and cannot be adjusted.

Switching point on rising pressure (PH1 or PH2)

The upper pressure setting at which the pressure or vacuum switch will actuate the contact, for each stage, on rising pressure.

Adjustable throughout the range on rising pressure.

Switching point on falling pressure (PB1 or PB2)

The pressure at which the switch contact changes state, for each stage, on falling pressure.

The lower point (PB) is not adjustable and is entirely dependent on the high point setting (PH) and the natural differential of the switch.

Differential

$PH - PB = \text{natural differential}$
The difference between the switching point on rising pressure (PH) and the switching point on falling pressure (PB), for each stage.

This point is not adjustable and therefore, the value of the differential is fixed. It is the natural differential of the switch (contact differential, friction, etc.), for each of its 2 stages.

Example:
stage 1 = segment EF
stage 2 = segment GH

For stage 2 (segment GH):

■ Consider a switching point on rising pressure (PH2) of 20 bar (set value at which contact 2 will change state on rising pressure).

■ It can be seen that the switching point on falling pressure (PB2) is 14 bar (fixed value at which contact 2 will return to its original state).

Conclusion:
for stage 2, the differential will be:
 $20 - 14 = 6 \text{ bar}$.

Repeat the same procedure for stage 1 (segment EF).

- 1 Maximum spread
- 2 Minimum spread

Electromechanical pressure and vacuum switches

XM range

XML switches for control circuits

Presentation

XML pressure and vacuum switches are designed for use in control circuits. They are used to control the pressure of hydraulic oils, fresh water, sea water, air, steam, corrosive fluids or viscous products, up to 500 bar.

XMLA pressure and vacuum switches have a fixed differential and are used for detection of a single threshold. They incorporate 1 CO single-pole contact.

XMLB pressure and vacuum switches have an adjustable differential and are used for regulation between 2 thresholds. They incorporate 1 CO single-pole contact.

XMLC pressure and vacuum switches have an adjustable differential and are used for regulation between 2 thresholds. They incorporate 2 CO single-pole contacts.

XMLD pressure and vacuum switches are dual stage switches, each stage with a fixed differential, and are used for detection at each threshold. They incorporate 2 CO single-pole contacts (one per stage).

Setting

When setting XML pressure and vacuum switches, adjust the switching point on rising pressure (PH) first and then the switching point on falling pressure (PB).

XMLA pressure and vacuum switches with fixed differential

Switching point on rising pressure

The switching point on rising pressure (PH) is set by adjusting the red screw **1**.

Switching point on falling pressure

The switching point on falling pressure (PB) is not adjustable.

The difference between the tripping and resetting points of the contact is the natural differential of the switch (contact differential, friction, etc.).

XMLB and XMLC pressure and vacuum switches with adjustable differential

Switching point on rising pressure

The switching point on rising pressure (PH) is set by adjusting the red screw **1**.

Switching point on falling pressure

The switching point on falling pressure (PB) is set by adjusting the green screw **2**.

XMLD dual stage pressure and vacuum switches with fixed differential for each threshold

Switching point on rising pressure of stage 1 and stage 2

The first stage switching point on rising pressure (PH1) is set by adjusting the red screw **1**.

The second stage switching point on rising pressure (PH2) is set by adjusting the blue screw **2**.

Switching point on falling pressure

The switching points on falling pressure (PB1 and PB2) are not adjustable.

The difference between the tripping and resetting points of each contact is the natural differential of the switch (contact differential, friction, etc.).

Electromechanical pressure switches

XM range

For control circuits, ACW and ADW switches

Presentation

Pressure switches ACW and ADW are switches for control circuits, with an adjustable differential.

Pressure switches ACW are used to control the pressure of air, oils and other non corrosive fluids, up to 131 bar.

Pressure switches ADW are used to control the pressure of oils (including synthetic), up to 340 bar.

Setting, operating principle

Pressure switches ACW

The switching point on falling pressure (low point - PB) is adjusted using screw **1**.

The switching point on rising pressure (high point - PH) is made by adjusting screw **2**. This sets the differential between the low and high points, giving a switching point on rising pressure of the displayed low point setting plus the differential setting.

The two adjustments are completely independent.

Contact block operation

When the rising pressure reaches the high point setting (low point setting + differential setting), contact B (1-2) opens and contact A (3-4) closes. The contacts remain actuated until the pressure falls back to the low point setting.

Pressure switches ADW

The switching point on rising pressure (high point - PH) is adjusted using screw **1**.

The switching point on falling pressure (low point - PB) is made by adjusting screw **2**. This sets the differential between the high and low points, giving a switching point on falling pressure of the displayed high point setting minus the differential setting.

The two adjustments are completely independent.

Contact block operation

When the rising pressure reaches the high point setting, contact B (1-2) opens and contact A (3-4) closes. The contacts remain actuated until the pressure falls back to the low point setting (high point setting - differential setting).

Environment characteristics				
Pressure switch type			ACW (bellows operated)	ADW (piston operated)
Conformity to standards			CE, IEC/EN 60947-5-1	
Product certifications			CSA, UL (Recognized), EAC	
Protective treatment			"TC"	
Materials			Zinc alloy case Phosphor bronze bellows	Zinc alloy case Pressure switches with drainage hole: Buna N diaphragm, steel piston, cast iron cylinder Pressure switches with Quad-Ring piston seal: Buna N diaphragm, Teflon and Viton seal, stainless steel piston and cylinder
Ambient air temperature (for operation)		°C	- 56...+ 85	- 30...+ 85
Fluids controlled			Air, oils and other non corrosive fluids, from - 73 to + 125°C	Oils and other fluids, from - 25 to + 120°C (for ADW5, ADW6, ADW7S1, ADW25 and ADW26) Oils (including synthetic) only, from - 30 to + 125°C (for ADW3, ADW4, ADW7, ADW23, ADW24 and ADW27)
Degree of protection			IP 65 conforming to IEC/EN 60529	
Fluid connection			G 1/4 (BSP female) conforming to NF E 03-005, ISO 228	G 3/8 (BSP female) conforming to NF E 03-005, ISO 228

Possible differential (subtract from PH to give PB)	1 CO switches	Min.	2.4 bar (34.8 psi)	6.9 bar (100 psi)	8.6 bar (124.7 psi)
		Max.	9.3 bar (135 psi)	28 bar (406 psi)	38 bar (551 psi)
Maximum permissible pressure		690 bar (10,000 psi)			
Fluids controlled		Oils (including synthetic) only, from - 30°C to + 125°C (2) (3)			
Mechanical life		1 x 10 ⁶ operating cycles (average value, depending on application)			
Cable entry, screw terminals		ADW●M129012	1 tapped entry for n° 13 cable gland, conforming to NF C 68-300 (DIN Pg 13.5). Clamping capacity 9 to 13 mm		

(1) Since it is normal for piston type pressure switches (not incorporating a piston seal) to have a slight oil leakage past the piston, a drain hole through the cylinder wall is incorporated.

To avoid back pressure, this hole should never be plugged. If for any reason this oil leakage is undesirable, use pressure switches incorporating a Quad-Ring piston seal.

Electromechanical pressure switches

XM range

For control circuits, XMX and XMA switches

Presentation

Pressure switches XMX and XMA are switches for control circuits, with an adjustable differential.

They are used to control the pressure of water and air, up to 25 bar.

Equipment fitted to the various models

Location of setting screw

Pressure switches XMX have an internal setting screw that is only accessible after removing the cover.

Pressure switches XMA have an external setting screw that is accessible without removing the cover.

Case

Pressure switches XMX have a black opaque case.

Pressure switches XMA can have a transparent case or a black opaque case.

Setting

When setting pressure switches XMX or XMA, adjust the switching point on rising pressure (PH) first and then the switching point on falling pressure (PB).

Switching point on rising pressure

The switching point on rising pressure (PH) is set by adjusting screw-nut **1**.

Switching point on falling pressure

The switching point on falling pressure (PB) is set by adjusting screw-nut **2**.

Environment characteristics

Presentation

FSG and FYG pressure switches are intended for use in power circuits to control the pressure of water, up to 10.5 bar.

They feature an adjustable differential, for regulation between 2 thresholds.

Setting

When setting the pressure switch, adjust the switching point on rising pressure (PH) first and then the switching point on falling pressure (PB).

Switching point on rising pressure

The switching point on rising pressure (PH) is set by adjusting screw-nut **1**.

Switching point on falling pressure

The switching point on falling pressure (PB) is set by adjusting screw-nut **2**.

Environment characteristics

Pressure switch type		FSG● and FYG●	
Conformity to standards		CE, IEC/EN 60730	
Protective treatment		Standard version: "TC"	
Ambient air temperature	For operation	°C	0...+ 45.
	For storage	°C	- 30...+ 80
Fluids controlled		Fresh water, sea water (0...+ 70°C)	
Materials	Case	Polystyrene, resistant to mechanical impact	
	Component materials in contact with fluid	Nylon 6/6, zinc plated steel, nitrile	
Operating position		All positions	
Electric shock protection		Class I conforming to IEC 536	
Degree of protection conforming to IEC/EN 60529		IP 20	
Operating rate		Op. cycles/h	600
Repeat accuracy		< 2%	
Fluid connection	F●G 2, FYG●2	G 1/4 (BSP female) conforming to NF E 03-005, ISO 228	
	F●G 9	R 1/4 (BSP male) conforming to NF E 03-004, ISO 7	
Electrical connection		FSG● and FYG●	Terminals. 2 cable entries, with grommet

Contact block characteristics

Rated operational characteristics		Ie = 10 A, Ue = ~ 250 V conforming to EN 60730-1	
Power ratings of controlled motors	Voltage	~ 2-pole 1-phase	~ 2-pole 3-phase
	110 V	0.75 kW (1 HP)	1.1 kW (1.5 HP)
	230 V	1.5 kW (2 HP)	2.2 kW (3 HP)
	400 V	1.5 kW (2 HP)	2.2 kW (3 HP)
Rated insulation voltage conforming to IEC/EN 60947-1		Ui = 500	
Rated impulse withstand voltage conforming to IEC/EN 60947-1		U imp = 6	
Type of contacts		1 2-pole 2 NC (4 terminal) contact, snap action	
Short-circuit protection		20 A cartridge fuse type gG	
Connection		Screw clamp terminals.	
	Minimum clamping capacity	mm²	1 x 1
	Maximum clamping capacity	mm²	2 x 2
Electrical durability at an operating rate of 600 operating cycles/hour		100 000

Presentation

XMP pressure switches are switches for power circuits (direct switching), with an adjustable differential.

They are used to control the pressure of water and air, up to 25 bar.

Equipment fitted to the various models

Case

XMP Pressure switches, depending on the model, include:

- 3 types of case:
 - bare case,
 - case with On/Off knob (black): used as a switch for starting and stopping the installation,
 - case with reset knob (yellow): necessary when the safety requirements of the system include tripping in the event of overpressure. Resetting is not automatic on return to normal pressure, and it can only be achieved by manually turning the "Reset" knob.
- 2 degrees of protection:
 - IP 54
 - IP 65

Decompression valve

Depending on the model, 2 types of decompression valve can be fitted to XMP pressure switches:

- Straight, instant connection, decompression valve (connection by Ø 6 mm plastic tube).
- Straight, olive connection, decompression valve (connection by Ø 6 mm plastic or metal tube).

Setting

When setting XMP pressure switches, adjust the switching point on rising pressure (PH) first and then the switching point on falling pressure (PB).

Switching point on rising pressure

The switching point on rising pressure (PH) is set by adjusting the screw-nut or knurled knob **1**.

Tighten either the nut or knurled knob **1** to increase the high point switching value.

Switching point on falling pressure

The switching point on falling pressure is set by adjusting screw-nut **2**.

Tighten nut **2** to reduce the low point switching value (increase in differential).

Environment characteristics				
Conformity to standards		CE, IEC/EN 60947-4-1		
Product certifications		EAC		
Ambient air temperature	°C	For operation: - 25...+ 70 For storage: - 40...+ 70		
Fluids controlled		Air, fresh water, sea water (0...+ 70°C)		
Materials		Case: polyamide impregnated with fibreglass Component materials in contact with fluid: chromated zinc alloy (fluid entry), canvas covered nitrile (diaphragm)		
Operating position		All positions		
Vibration resistance		3 gn (10...500 Hz) conforming to IEC 60068-2-6

Electromechanical pressure switches

XMP switches, IP 54

Size 12 to 25 bar (174 to 362.5 psi)

Adjustable differential, for regulation between 2 thresholds

Switches with 2-pole 2 NC or 3-pole 3 NC contact

Fluid connection	G 1/4 (female)
------------------	----------------

1

2

Adjustable range of switching point (PH) (Rising pressure)	1.3...12 bar (18.85...174 psi)	
Type of contact	2-pole 2 NC	3-pole 3 NC

References (1)

Switches without decompression valve

Bare case 1	XMPA12B2131	XMPA12C2131
-------------	-------------	-------------

Case with On/Off knob 2	XMPC12B2131	-
-------------------------	-------------	---

Weight (kg)	0.430	
-------------	-------	--

Switches with straight decompression valve, instant connection

Case with On/Off knob 2	-	XMPE12C2131
-------------------------	---	-------------

Weight (kg)	0.450	
-------------	-------	--

Switches with straight decompression valve, olive connection

Case with On/Off knob 2	-	XMPR12C2131
-------------------------	---	-------------

Weight (kg)	0.450	
-------------	-------	--

Complementary characteristics not shown under general characteristics (page 75)

Possible differential (subtract from PH to give PB)	Min. at low setting	1 bar (14.5 psi)
	Min. at high setting	1.7 bar (24.6 psi)
	Max. at high setting	8.4 bar (121.8 psi)
Destruction pressure	30 bar (435 psi)	
Mechanical life	1 million operating cycles	
Cable entry	2 entries tapped for n° 13 cable gland, conforming to NF C 68-300 (DIN Pg 13.5)	
Pressure switch type	Diaphragm	

(1) References for individually packaged switches. Also available packaged in lots of 10.
To order, add the letter C to the reference selected from above. Example: reference for lot
of 10 pressure switches XMPA12B2131 in one package becomes XMPA12B2131C.
